

# The Invisible Revolution: Mapping the \$834B Embedded Finance Landscape

From Discrete to Integrated: Financial services are moving from separate, noticeable transactions to invisible experiences integrated within non-financial brands.

## The Trillion-Dollar Trajectory

## The 3-Layer Ecosystem

### Distributors (The Face)

**Consumer-Facing Brands**  
Non-financial platforms integrate these services to increase customer loyalty and lifetime value.

### Balance Sheet Firms (The Vaults)

**Regulated Financial Foundations**  
Licensed institutions like Goldman Sachs or chartered banks hold the capital, manage risk, and provide the underlying banking license.

### Technology Providers (The Pipes)

**Infrastructure and API Platforms**  
Firms provide the digital "pipes" that strip away compliance and coding complexity for brands.

## The Five Pillars of Embedded Finance

**Embedded Payments**  
**Seamless Transaction Journeys**  
Enabling "invisible" payments within apps, like ride-sharing or Starbucks mobile wallet.

**Embedded Lending**  
**Point-of-Sale Credit**  
Buy Now, Pay Later (BNPL) services like Klarna and Afterpay offering instant liquidity at checkout.

**Embedded Insurance**  
**Protection at the Point of Risk**  
Offering relevant coverage when needed, like Tesla's real time driving insurance or travel insurance during booking.

**Embedded Banking**  
**Branded Financial Accounts**  
Non-bank platforms offering business accounts or debit cards, exemplified by Shopify Balance.

**Embedded Investing**  
**Integrated Asset Management**  
Round-up features (Acorns) or stock trading capabilities integrated into social or payment apps (Cash App).

## Strategic Outlook: Benefits vs. Risks

Stakeholder	Primary Benefit	Key Risk
Consumers	✓ Unprecedented convenience and financial inclusion	⚠ Debt traps from frictionless borrowing
Businesses	✓ New revenue streams and "sticky" ecosystems	⚠ Regulatory compliance and reputational risk
Traditional Banks	✓ Diversified revenue by acting as backend providers	⚠ Disintermediation from the customer relationship

## The SaaS Evolution

**SaaS 1.0: Software Company**  
**Pure Subscription Model**  
Revenue is generated primarily through software subscription fees.

**SaaS 2.0: Software Platform**  
**Added Payment Layer**  
Platforms begin capturing revenue through integrated online payment processing.

**SaaS 3.0: Commerce Platform**  
**Full Financial Stack**  
The final stage includes lending, card issuing, instant payouts, and point-of-sale hardware.

**\$834  
Billion**

Projected market value by  
2034, growing from \$104.8B  
in 2024.

## Executive Summary

### The Core Definition

Embedded finance is the integration of financial services (lending, payment processing, insurance) into non-financial infrastructures without redirecting to traditional institutions.

### The Shift

We are moving from banking as a place you go to banking as a thing you do.

The era of the standalone bank branch is ending. The future of finance is code running in the background of apps like Uber, Shopify, and Tesla.

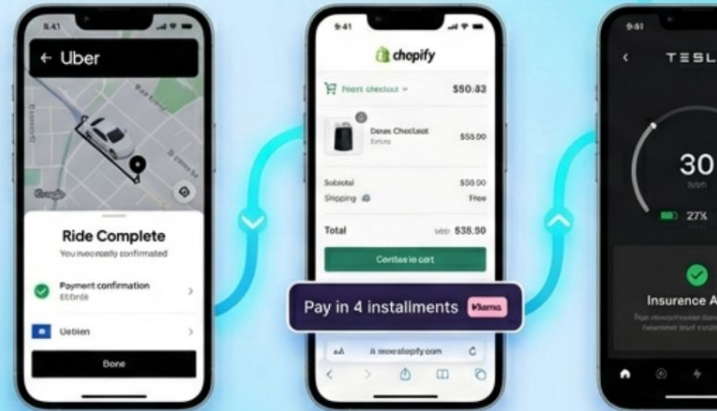

# The Concept: The Visible vs. The Invisible

## The Destination (Old World)

High Friction. Siloed. Separate logins and physical locations.

## The Utility (New World)

Zero Friction. Integrated. The financial product exists exactly where the customer needs it.

# The 4 Forces Driving the Shift

## 1. The API Revolution

APIs have allowed banks to open their infrastructure. What once required massive IT investment can now be accomplished through plug-and-play integrations.

## 2. The E-Commerce Default

As commerce moved online, the payment layer had to become invisible to reduce cart abandonment. Digital transactions are now

## 3. Death of Loyalty

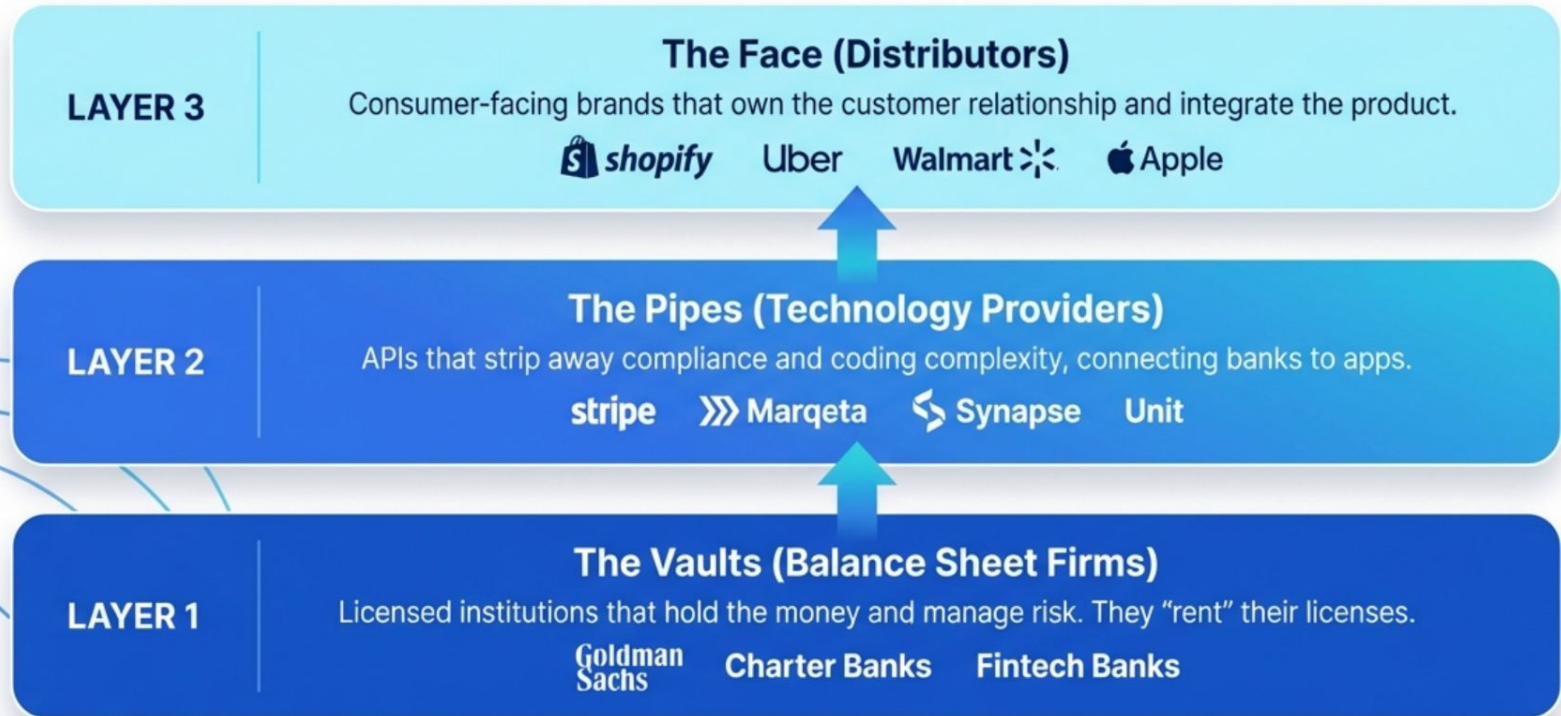

Millennials and Gen Z prioritize UX over institutional history. They are comfortable managing money via apps and have little attachment to legacy bank brands.

## 4. Data Richness

Platforms like Amazon or Uber possess real-time behavioral data that allows for better understanding and personalization than a traditional bank's limited view.

# The Ecosystem: A Three-Layer Architecture

Value Chain

# The 7 Flavors: High-Volume Transactions

## Embedded Payments

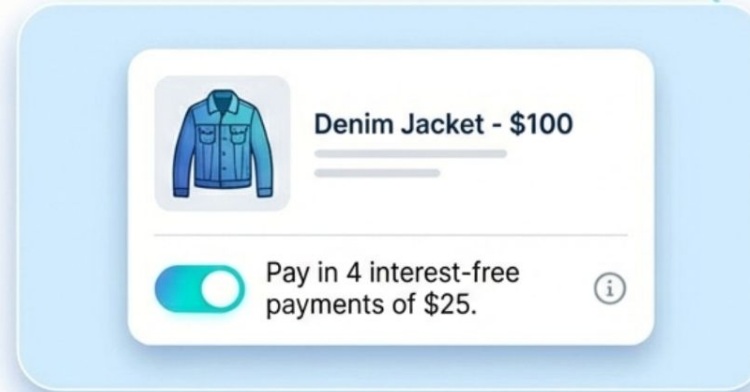

**Concept:** The ability to pay without pulling out a card.

**Examples:** Uber (invisible background payment), Starbucks (stored value wallet).

**Goal:** Zero friction.

## Embedded Lending (BNPL)

**Concept:** Credit offered instantly at the point of sale.

**Examples:** Klarna, Afterpay.

**Benefit:** Increases conversion rates; instant liquidity without loan applications.

# The 7 Flavors: The Expanding Frontier

## Embedded Banking

Non-financial companies offering checking/debit accounts.

**Example:** Shopify Balance (credit/debit card)

## Embedded Insurance

Coverage offered exactly when the risk is created.

**Example:** Tesla (real-time insurance)

## Embedded Investment

API-driven investment accounts within non-investment apps.

**Example:** Acorns (rounding up investments)

# The Value Proposition

## The Business Case

- **Sticky Ecosystems:** If a platform holds money, retention increases.
- **New Revenue:** Access to financial revenue streams (LTV increase).
- **Better Data:** Insight into spending behavior enhances product dev.

## The Consumer Case

- **Convenience:** Managing finances where time is already spent.
- **Inclusion:** Access for the underbanked via trusted apps.
- **Personalization:** Offers based on actual needs, not generic marketing.

# The Risks & Challenges

## The Debt Trap

Frictionless one-click loans can lead consumers to overextend themselves, specifically with BNPL.

## Privacy Erosion

Combining purchase history with banking history creates a terrifyingly complete picture of private lives.

## Regulatory Complexity

Who is responsible? As the chain fragments between App, Tech Provider, and Bank, accountability is obscured.

## Security Risks

Every API connection is a potential attack surface. Integration complexity introduces operational vulnerabilities.

# Differentiating the Landscape

## Open Banking

Banks letting third parties view data (with permission).

**The Foundation.** It is about **ACCESS**.

## Embedded Finance

Integrating financial services into non-financial interfaces using centralized backbones.

**The Application.** It is about **INTEGRATION**.

## DeFi

Using blockchain and smart contracts to remove the central authority entirely.

**The Alternative.** It attempts to **REPLACE** the backbone.

# Market Trajectory: A Structural Shift

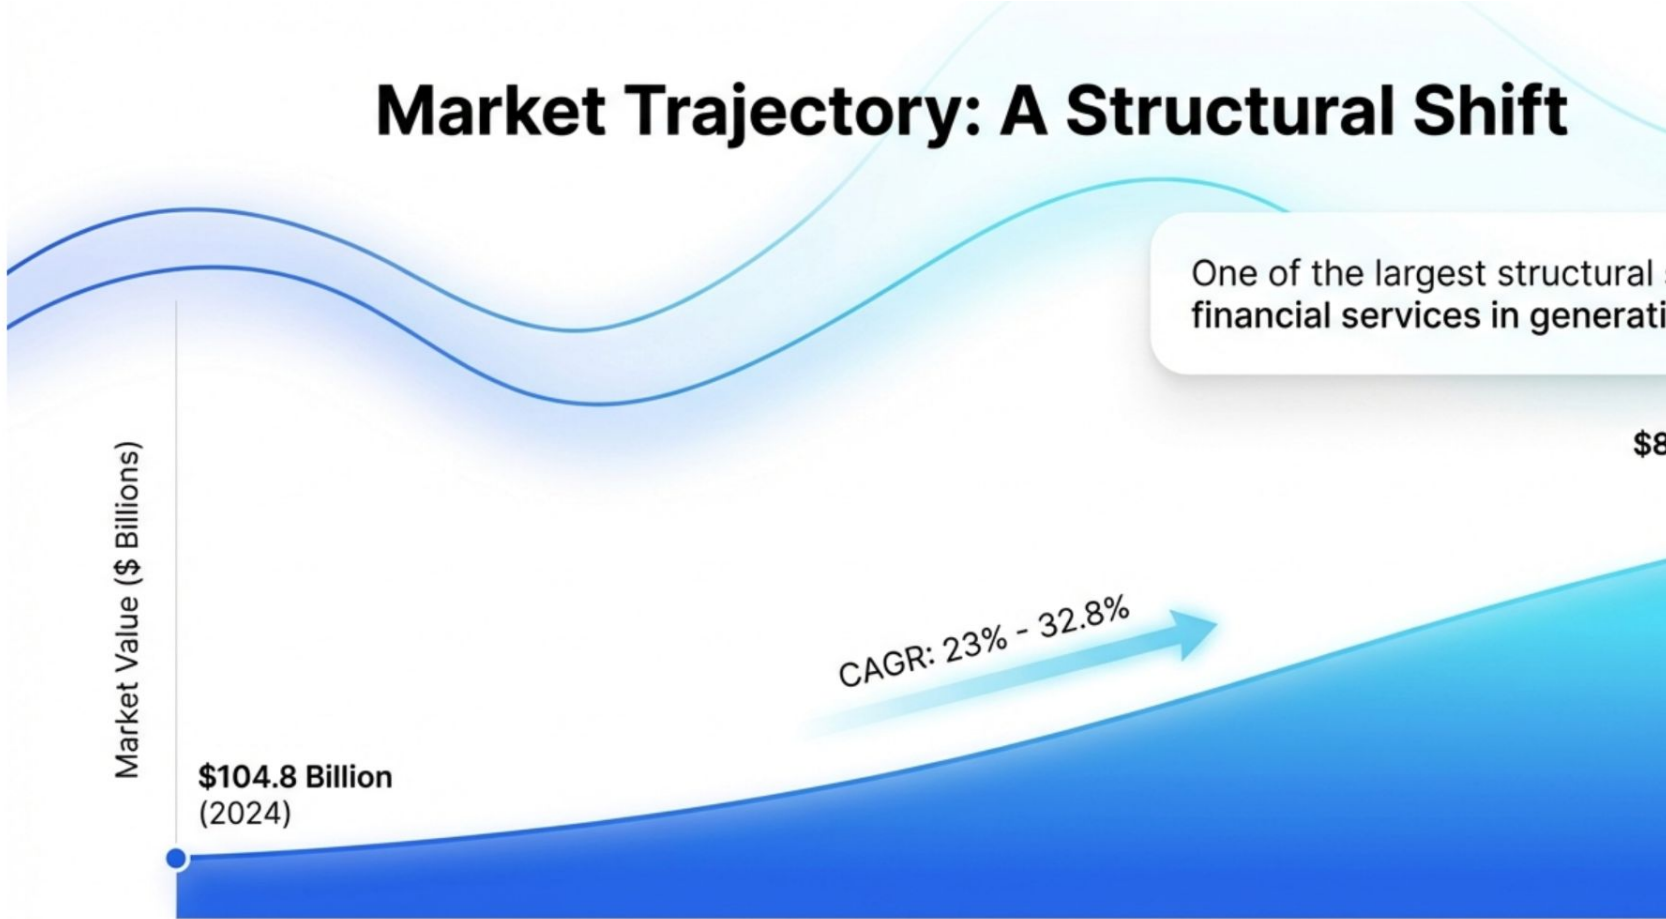

One of the largest structural  
financial services in generati

Market Value (\$ Billions)

**\$104.8 Billion**  
(2024)

CAGR: 23% - 32.8%

\$8

# Strategic Implications

## For Entrepreneurs

The space is early. Build infrastructure or creatively integrate finance to solve user problems, not just to monetize.

## For Investors

Understand the layers. Returns vary between Tech Providers (SaaS multiples), Balance Sheet Firms (Risk), and Distributors (Volume).

## For Legacy Banks

Partner or perish. Become a backend provider (The Vault) enabling this shift, or risk disintermediation.

# The Future is Invisible.

We are moving toward a world where every company will be a fintech company.

The transformation has already begun. It is just happening inside apps you never thought of as financial institutions.

# The Invisible Revolution: A Guide to Embedded Finance

## What is Embedded Finance?

The integration of banking, lending, insurance, or investing directly into non-financial apps and platforms, such as paying for a ride-share without a wallet.

**Market by 2034  
(23% CAGR).**

\$104.8  
Billion

\$834  
Billion

2024

2034

### Every Company is a Fintech Company.

Non-financial brands can now capture deeper customer relationships and new revenue streams by offering specialized financial tools.

## Drivers vs. Risks

### Driver: The API Revolution

Modern APIs allow banks to 'rent out' their infrastructure, making integration fast and cost-effective.

### Driver: Consumer Expectations

Younger generations prioritize convenience and digital-first experiences over legacy bank brand loyalty.

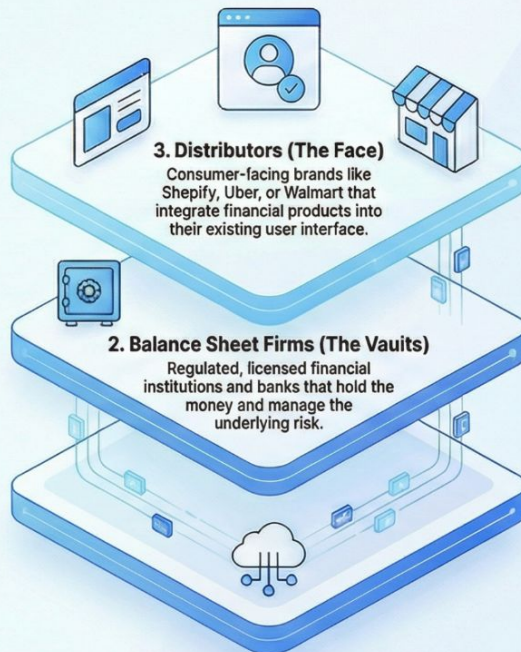

### Risk: The 'Debt Trap'

Frictionless one-click loans can lead consumers to overextend themselves financially without realizing the weight of the debt.

### Risk: Data & Compliance

Platforms gain access to sensitive financial data, raising major privacy concerns and complex regulatory accountability.

## The Three-Layer Ecosystem

### 3. Distributors (The Face)

Consumer-facing brands like Shepify, Uber, or Walmart that integrate financial products into their existing user interface.

### 2. Balance Sheet Firms (The Vaults)

Regulated, licensed financial institutions and banks that hold the money and manage the underlying risk.

### 1. Technology Providers (The Pipes)

API and cloud platforms like Stripe, Marqeta, or Synapse that connect financial institutions to consumer apps.

## The Four Flavors of Integration

### Embedded Payments & Banking

Automatic ride-share payments (Uber) or business checking accounts for e-commerce merchants (Shopify Balance).

### Embedded Lending (BNPL)

Point-of-sale financing at checkout through services like Klarna or Afterpay, reducing purchase friction.

### Embedded Insurance

Tesla offering insurance programs during vehicle purchase based on real-time driving data.

### Embedded Investing

Apps like Acorns or Cash App that allow users to buy stocks or 'round up' change into investments seamlessly.

## Competitive Landscape

	Open Banking	Embedded Finance	DeFi
<b>Core Mechanism</b>	Bank-provided API access to customer data	Non-banks integrating financial services	Blockchain and smart contracts
<b>Focus</b>	Third-party data transparency	New distribution channels	Removing central authorities

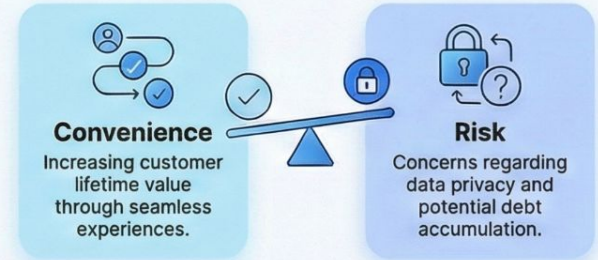

# \$834 Billion Embedded Finance Ecosystem

Embedded finance is the integration of banking, lending, and insurance directly into non-financial apps and platforms, shifting banking from a “place you go” to a “thing you do,” creating a seamless utility within everyday digital experiences.

## MARKET IMPACT AND CORE PILLARS

## CONVENIENCE VS. RISK

## The Five Pillars of Integration

### The Technology Providers (The Pipes)

Infrastructure firms using APIs to connect financial institutions with consumer-facing applications.

### The Balance Sheet Firms (The Vaults)

Regulated, licensed institutions that hold deposits and manage underlying financial risks.

### The Distributors (The Face)

Non-financial brands like Uber or Shopify that integrate services into their user interface.

## THE THREE-LAYER ECOSYSTEM
